

COMMERCIAL BELL SAFETY HARNESS

A diver recovery harness utilising ergonomically designed for comfort and safety. This diver harness can be used for work safety. If a diver becomes unconscious or incapacitated they will be rescued and recovered to the diving bell via a recovery hoist. The recovery hoist will be attached to the divers harness and the diver would be raised into the diving bell to receive treatment. The harness acts as the strong point to attach the divers umbilical. Lifting can be via the rear of the neck recovery lifting point or using a spreader bar across the two front recovery lifting points (certified triangular shaped D-rings).

The bell safety harness is available in two sizes (small and standard), both are fully adjustable as to its position, which allows divers of different sizes to position and lock it in the most suitable place.

Independently tested against the European Standard 15333-1:2008

Stainless steel slide lock adjustment buckles (qty 6)

Certified diver recover lifting points - special triangular shaped stainless steel d-rings (qty 5)
